

Dual 4A per Channel Low V_{IN} DC/DC μ Module Regulator

FEATURES

- Dual 4A Output Power Supply
- Input Voltage Range: 2.375V to 5.5V
- 4A DC Typical, 5A Peak Output Current Each
- 0.8V Up to 5V Output Each, Parallelable
- $\pm 2\%$ Max Total DC Output Error ($0^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$)
- Output Voltage Tracking
- Up to 95% Efficiency
- Programmable Soft-Start
- Short-Circuit and Overtemperature Protection
- Power Good Indicators
- Small and Very Low Profile Package:
15mm \times 15mm \times 2.82mm

APPLICATIONS

- Telecom and Networking Equipment
- FPGA Power
- SERDES and Other Low Noise Applications

DESCRIPTION

The LTM[®]4614 is a complete 4A dual output switching mode step-down μ Module[®] regulator. Included in the package are the switching controllers, power FETs, inductors and all support components. The dual 4A DC/DC converters operate over an input voltage range of 2.375V to 5.5V. The LTM4614 supports output voltages ranging from 0.8V to 5V. The regulator output voltages are set by a single resistor for each output. Only bulk input and output capacitors are needed to complete the design.

The low profile package (2.82mm) enables utilization of unused space on the bottom of PC boards for high density point of load regulation.

Additional features include overvoltage protection, foldback overcurrent protection, thermal shutdown and programmable soft-start. The power module is offered in a space saving and thermally enhanced 15mm \times 15mm \times 2.82mm LGA package. The LTM4614 is RoHS compliant with Pb-free finish.

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.

Note 2: The LTM4614 is tested under pulsed load conditions such that $T_J \approx T_A$. The LTM4614E is guaranteed to meet performance specifications over the 0°C to 125°C internal operating temperature range. Specifications over the -40°C to 125°C internal operating temperature range are assured by design, characterization and correlation with statistical process controls. The LTM4614I is guaranteed to meet specifications over the full internal operating temperature range. Note that the maximum ambient

temperature consistent with these specifications is determined by specific operating conditions in conjunction with board layout, the rated package thermal resistance and other environmental factors.

Note 3: The IC has overtemperature protection that is intended to protect the device during momentary overload conditions. Junction temperatures will exceed 125°C when overtemperature is activated. Continuous overtemperature activation can impair long-term reliability.

Note 4: See output current derating curves for different V_{IN} , V_{OUT} and T_A .

Note 5: Two channels are tested separately and the specified test conditions are applied to each channel.

PIN FUNCTIONS

V_{IN1} , V_{IN2} (J1-J6, K1-K6); (C1-C6, D1-D6): Power Input Pins. Apply input voltage between these pins and GND pins. Recommend placing input decoupling capacitance directly between V_{IN} pins and GND pins.

V_{OUT1} , V_{OUT2} (J9-J12, K9-K12, L9-L12, M9-M12); (C9-C12, D9-D12, E9-E12, F9-F12): Power Output Pins. Apply output load between these pins and GND pins. Recommend placing output decoupling capacitance directly between these pins and GND pins. Review Table 4.

GND1, GND2, (G1-G12, H1, H7-H12, J7-J8, K7-K8, L1, L7-L8, M1-M8); (A1-A12, B1, B7-B12, C7-C8, D7-D8, E1, E7-E8, F1-F8): Power Ground Pins for Both Input and Output Returns.

TRACK1, TRACK2 (L3, E3): Output Voltage Tracking Pins. When the module is configured as a master output, then a soft-start capacitor is placed on the RUN/SS pin to ground to control the master ramp rate, or an external ramp can be applied to the master regulator's track pin to control it.

4614fb

PIN FUNCTIONS

Slave operation is performed by putting a resistor divider from the master output to the ground, and connecting the center point of the divider to this pin on the slave regulator. If tracking is not desired, then connect the TRACK pin to V_{IN} . Load current must be present for tracking. See the Applications Information section.

FB1, FB2 (L6, E6): The Negative Input of the Switching Regulators' Error Amplifier. Internally, these pins are connected to V_{OUT} with a 4.99k precision resistor. Different output voltages can be programmed with an externally connected resistor between the FB and GND pins. Two power modules can current share when this pin is connected in parallel with the adjacent module's FB pin. See the Applications Information section.

COMP1, COMP2 (L5, E5): Current Control Threshold and Error Amplifier Compensation Point. The current comparator threshold increases with this control voltage. Two power modules can current share when this pin is connected in parallel with the adjacent module's COMP pin. Each channel has been internally compensated. See the Applications Information section.

PGOOD1, PGOOD2 (L4, E4): Output Voltage Power Good Indicator. Open-drain logic output that is pulled to ground when the output voltage is not within $\pm 7.5\%$ of the regulation point.

RUN/SS1, RUN/SS2 (L2, E2): Run Control and Soft-Start Pins. A voltage above 0.9V will turn on the module, and below 0.6V will turn off the module. This pin has a 1M resistor to V_{IN} and a 1000pF capacitor to GND. The voltage on the RUN/SS pin clamps the control loop's current comparator threshold. A RUN/SS pin voltage of 2.375V upon completion of soft-start guarantees the regulator can deliver full output current. To turn off the module while V_{IN} remains active, the RUN/SS pin should be pulled low with a falling edge $\leq 1\mu\text{s}$ to ensure the device does not transition slowly through the internal undervoltage lockout threshold. See Applications Information section for soft-start information.

SW1, SW2 (H2-H6, B2-B6): The switching node of the circuit is used for testing purposes. This can be connected to copper on the board for improved thermal performance.

OPERATION**LTM4614 POWER MODULE DESCRIPTION**

The LTM4614 is a standalone dual nonisolated switching mode DC/DC power supply. It can deliver up to 4A of DC output current for each channel with few external input and output capacitors. This module provides two precisely regulated output voltages programmable via one external resistor for each channel from 0.8V DC to 5V DC over a 2.375V to 5.5V input voltage. The typical application schematic is shown in Figure 12.

The LTM4614 has two integrated constant frequency current mode regulators, with built-in power MOSFETs with fast switching speed. The typical switching frequency is 1.25MHz. With current mode control and internal feedback loop compensation, these switching regulators have sufficient stability margins and good transient performance under a wide range of operating conditions and with a wide range of output capacitors, even all ceramic output capacitors.

Current mode control provides cycle-by-cycle fast current limit. Besides, current limiting is provided in an overcurrent condition with thermal shutdown. In addition, internal overvoltage and undervoltage comparators pull the

open-drain PGOOD outputs low if the particular output feedback voltage exits a $\pm 7.5\%$ window around the regulation point. Furthermore, in an overvoltage condition, internal top FET, M1, is turned off and bottom FET, M2, is turned on and held on until the overvoltage condition clears, or current limit is exceeded.

Pulling each specific RUN pin below 0.8V forces the specific regulator controller into its shutdown state, turning off both M1 and M2 for each power stage. At low load current, each regulator works in continuous current mode by default to achieve minimum output voltage ripple.

The TRACK and RUN/SS pins are used for power supply tracking and soft-start programming for each specific regulator. See the Applications Information section.

The LTM4614 is internally compensated to be stable over the operating conditions. Table 4 provides a guideline for input and output capacitance for several operating conditions. The LTpowerCAD™ GUI is available for transient and stability analysis.

The FB pins are used to program the specific output voltage with a single externally connected resistor to ground.

APPLICATIONS INFORMATION

Dual Switching Regulator

A typical LTM4614 application circuit is shown in Figure 12. External component selection is primarily determined by the maximum load current and output voltage. Refer to Table 4 for specific external capacitor requirements for a particular application.

V_{IN} to V_{OUT} Step-Down Ratios

There are restrictions in the maximum V_{IN} and V_{OUT} step-down ratio than can be achieved for a given input voltage on the two switching regulators. The LTM4614 is 100% duty cycle capable, but the V_{IN} to V_{OUT} minimum dropout will be a function the load current. A typical 0.5V minimum is sufficient. See Typical Performance Characteristics.

Output Voltage Programming

Each regulator channel has an internal 0.8V reference voltage. As shown in the Block Diagram, a 4.99k internal feedback resistor connects the V_{OUT} and FB pins together. The output voltage will default to 0.8V with no externally applied feedback resistor. Adding a resistor R_{FB} from the FB pin to GND programs the output voltage:

$$V_{OUT} = 0.8V \cdot \frac{4.99k + R_{FB}}{R_{FB}}$$

Table 1. FB Resistor Table vs Various Output Voltages

| V _{OUT} | 0.8V | 1.0V | 1.2V | 1.5V | 1.8V | 2.5V | 3.3V |
|------------------|------|------|------|-------|-------|-------|-------|
| R _{FB} | Open | 20k | 10k | 5.76k | 3.92k | 2.37k | 1.62k |

Input Capacitors

The LTM4614 module should be connected to a low AC impedance DC source. One 4.7μF ceramic capacitor is included inside the module for each regulator channel. Additional input capacitors are needed if a large load step is required up to the full 4A level and for RMS ripple current requirements. A 47μF bulk capacitor can be used for more input bulk capacitance. This 47μF capacitor is only needed if the input source impedance is compromised by long inductive leads or traces.

For a buck converter, the switching duty cycle can be estimated as:

$$D = \frac{V_{OUT}}{V_{IN}}$$

Without considering the inductor current ripple, the RMS current of the input capacitor can be estimated as:

$$I_{CIN(RMS)} = \frac{I_{OUT(MAX)}}{\eta\%} \cdot \sqrt{D \cdot (1-D)}$$

In the above equation, η% is the estimated efficiency of the power module. The bulk capacitor can be a switcher-rated aluminum electrolytic OS-CON or polymer capacitor. If a low inductance plane is used to power the device, then no input capacitance is required. The internal 4.7μF ceramics on each channel input are typically rated for 1A of RMS ripple current up to 85°C operation. The worst-case ripple current for the 4A maximum current is 2A or less. An additional 10μF or 22μF local ceramic capacitor can be used to supplement the internal capacitor with an additional 1A to 2A ripple current rating. See Figure 11 for recommended PCB layout.

Output Capacitors

The LTM4614 switchers are designed for low output voltage ripple on each channel. The bulk output capacitors are chosen with low enough effective series resistance (ESR) to meet the output voltage ripple and transient requirements. The output capacitors can be low ESR tantalum capacitors, low ESR polymer capacitors or ceramic capacitors. The typical output capacitance range is 66μF to 100μF. Additional output filtering may be required by the system designer if further reduction of output ripple or dynamic transient spikes is required. Table 4 shows a matrix of different output voltages and output capacitors to minimize the voltage droop and overshoot during a 2A/μs transient. The table optimizes total equivalent ESR and total bulk capacitance to maximize transient performance. See Figure 11 for recommended PCB layout.

APPLICATIONS INFORMATION

Fault Conditions: Current Limit and Overcurrent Foldback

The LTM4614 has current mode control, which inherently limits the cycle-by-cycle inductor current not only in steady-state operation, but also in transient.

Along with foldback current limiting in the event of an overload condition, the LTM4614 has overtemperature shutdown protection that inhibits switching operation around 150°C for each channel.

Run Enable and Soft-Start

The RUN/SS pins provide a dual function of enable and soft-start control for each channel. The RUN/SS pins are used to control turn on of the LTM4614. While each enable pin is below 0.6V, the LTM4614 will be in a low quiescent current state. At least a 0.9V level applied to the enable pins will turn on the LTM4614 regulators. The voltage on the RUN/SS pins clamp the control loop's current comparator threshold. A RUN/SS pin voltage of 2.375V upon completion of soft-start guarantees the regulator can deliver full output current. These pins can be used to sequence the regulator channels. Soft-start control is provided by a 1M pull-up resistor (R_{SS}) and a 1000pF capacitor (C_{SS}) as shown in the Block Diagram for each channel. Optionally, an external capacitor (C_{SSEXT}) can be applied to the RUN/SS pin to increase soft-start time. A typical value is

0.01 μ F. Soft-start time is approximately given by:

$$t_{\text{SOFTSTART}} = \ln\left(\frac{V_{\text{IN}}}{V_{\text{IN}} - 1.8\text{V}}\right) \cdot R_{\text{SS}} \cdot (C_{\text{SS}} + C_{\text{SSEXT}})$$

where R_{SS} and C_{SS} are shown in the Block Diagram of Figure 1, and 1.8V is the soft-start upper range. The soft-start function can also be used to control the output ramp-up time, so that another regulator can be easily tracked to it. To turn off the module while V_{IN} remains active, the RUN/SS pin should be pulled low with a falling edge $\leq 1\mu$ s to ensure the device does not transition slowly through the internal undervoltage lockout threshold.

Output Voltage Tracking

Output voltage tracking can be programmed externally using the TRACK pins. Either output can be tracked up or down with another regulator. The master regulator's output is divided down with an external resistor divider that is the same as the slave regulator's feedback divider to implement coincident tracking. The LTM4614 uses a very accurate 4.99k resistor for the internal top feedback resistor. Figure 2 shows an example of coincident tracking.

Equations:

$$\text{TRACK1} = \left(\frac{R_{\text{FB1}}}{4.99\text{k} + R_{\text{FB1}}}\right) \cdot \text{Master}$$

$$\text{Slave} = \left(1 + \frac{4.99\text{k}}{R_{\text{FB1}}}\right) \cdot \text{TRACK1}$$

Figure 2. Dual Outputs (1.5V and 1.2V) with Tracking

APPLICATIONS INFORMATION

TRACK1 is the track ramp applied to the slave's track pin. TRACK1 applies the track reference for the slave output up to the point of the programmed value at which TRACK1 proceeds beyond the 0.8V reference value. The TRACK1 pin must go beyond the 0.8V to ensure the slave output has reached its final value.

Ratiometric tracking can be achieved by a few simple calculations and the slew rate value applied to the master's TRACK pin. As mentioned above, the TRACK pin has a control range from 0V to 0.8V. The control ramp slew rate applied to the master's TRACK pin is directly equal to the master's output slew rate in Volts/Time.

The equation:

$$\frac{MR}{SR} \cdot 4.99k = R_{TB}$$

where MR is the master's output slew rate and SR is the slave's output slew rate in Volts/Time. When coincident tracking is desired, then MR and SR are equal, thus R_{TB} is equal to 4.99k. R_{TA} is derived from equation:

$$R_{TA} = \frac{0.8V}{\frac{V_{FB}}{4.99k} + \frac{V_{FB}}{R_{FB}} - \frac{V_{TRACK}}{R_{TB}}}$$

where V_{FB} is the feedback voltage reference of the regulator, and V_{TRACK} is 0.8V. Since R_{TB} is equal to the 4.99k top

feedback resistor of the slave regulator in equal slew rate or coincident tracking, then R_{TA} is equal to R_{FB} with $V_{FB} = V_{TRACK}$. Therefore $R_{TB} = 4.99k$ and $R_{TA} = 10k$ in Figure 2. Figure 3 shows the output voltage tracking waveform for coincident tracking.

In ratiometric tracking, a different slew rate maybe desired for the slave regulator. R_{TB} can be solved for when SR is slower than MR. Make sure that the slave supply slew rate is chosen to be fast enough so that the slave output voltage will reach it final value before the master output.

For example, $MR = 2.5V/ms$ and $SR = 1.8V/1ms$. Then $R_{TB} = 6.98k$. Solve for R_{TA} to equal to 3.24k. The master output must be greater than the slave output for the tracking to work. Output load current must be present for tracking to operate properly during power down.

Power Good

PGOOD1 and PGOOD2 are open-drain pins that can be used to monitor valid output voltage regulation. These pins monitor a $\pm 7.5\%$ window around the regulation point.

COMP Pin

This pin is the external compensation pin. The module has already been internally compensated for all output voltages. Table 4 is provided for most application requirements. The LTpowerCAD GUI is available for other control loop optimization.

Figure 3. Output Voltage Coincident Tracking

APPLICATIONS INFORMATION

Parallel Switching Regulator Operation

The LTM4614 switching regulators are inherently current mode control. Paralleling will have very good current sharing. This will balance the thermals on the design. Figure 13 shows a schematic of a parallel design. The voltage feedback equation changes with the variable N as channels are paralleled.

The equation:

$$V_{OUT} = 0.8V \cdot \frac{\frac{4.99k}{N} + R_{FB}}{R_{FB}}$$

N is the number of paralleled channels.

Thermal Considerations and Output Current Derating

The power loss curves in Figures 5 and 6 can be used in coordination with the load current derating curves in Figures 7 to 10 for calculating an approximate θ_{JA} thermal resistance for the LTM4614 with various heat sinking

and airflow conditions. Both of the LTM4614 outputs are at full 4A load current, and the power loss curves in Figures 5 and 6 are combined power losses plotted for both output voltages up to 4A each. The 4A output voltages are 1.2V and 3.3V. These voltages are chosen to include the lower and higher output voltage ranges for correlating the thermal resistance. Thermal models are derived from several temperature measurements in a controlled temperature chamber along with thermal modeling analysis. The junction temperatures are monitored while ambient temperature is increased with and without airflow. The junctions are maintained at $\sim 120^{\circ}\text{C}$ while lowering output current or power while increasing ambient temperature. The 120°C is chosen to allow for a 5°C margin window relative to the maximum 125°C . The decreased output current will decrease the internal module loss as ambient temperature is increased. The power loss curves in Figures 5 and 6 show this amount of power loss as a function of load current that is specified for both channels. The monitored junction temperature of 120°C minus the ambient operating temperature specifies how much

Figure 5. 1.2V Power Loss

Figure 6. 3.3V Power Loss

APPLICATIONS INFORMATION

module temperature rise can be allowed. As an example, in Figure 7 the load current is derated to 3A for each channel with 0LFM at ~90°C and the total combined power loss for both channels at 5V to 1.2V at 3A output is ~1.5 watts. If the 90°C ambient temperature is subtracted from the 120°C maximum junction temperature, then the difference of 30°C divided by 1.5W equals a 20°C/W thermal resistance. Table 2 specifies a 15°C/W value which is close. Table 2 and Table 3 provide equivalent thermal resistances for 1.2V and 3.3V outputs with and without air flow and

heat sinking. The combined power loss for the two 4A outputs can be summed together and multiplied by the thermal resistance values in Tables 2 and 3 for module temperature rise under the specified conditions. The printed circuit board is a 1.6mm thick four layer board with 2 ounce copper for the two outer layers and 1 ounce copper for the two inner layers. The PCB dimensions are 95mm × 76mm. The data sheet lists the θ_{JA} (junction to ambient) and θ_{JC} (junction to case) thermal resistances under the Pin Configuration diagram.

APPLICATIONS INFORMATION

Safety Considerations

The LTM4614 modules do not provide galvanic isolation from V_{IN} to V_{OUT} . There is no internal fuse. If required, a slow blow fuse with a rating twice the maximum input current needs to be provided to protect each unit from catastrophic failure.

Layout Checklist/Example

The high integration of LTM4614 makes the PCB board layout very simple and easy. However, to optimize its electrical and thermal performance, some layout considerations are still necessary.

- Refer to <http://www.linear.com/docs/29812> for device land pattern and stencil design.

- Use large PCB copper areas for high current paths, including V_{IN} , GND and V_{OUT} . It helps to minimize the PCB conduction loss and thermal stress.
 - Place high frequency ceramic input and output capacitors next to the V_{IN} , GND and V_{OUT} pins to minimize high frequency noise.
 - Place a dedicated power ground layer underneath the unit.
 - To minimize the via conduction loss and reduce module thermal stress, use multiple vias for interconnection between the top layer and other power layers.
 - Do not put vias directly on pads unless they are capped.
- Figure 11 gives a good example of the recommended layout.

PACKAGE DESCRIPTION

Please refer to <http://www.linear.com/designtools/packaging/> for the most recent package drawings.

LGA Package
144-Lead (15mm × 15mm × 2.82mm)
 (Reference LTC DWG # 05-08-1816 Rev B)

- NOTES:
1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994
 2. ALL DIMENSIONS ARE IN MILLIMETERS
 3. BALL DESIGNATION PER JEDEC MS-028 AND JEP95
 4. DETAILS OF PIN #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE PIN #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE
 5. PRIMARY DATUM -Z- IS SEATING PLANE
